A · Market Metro: planes and responsibilities

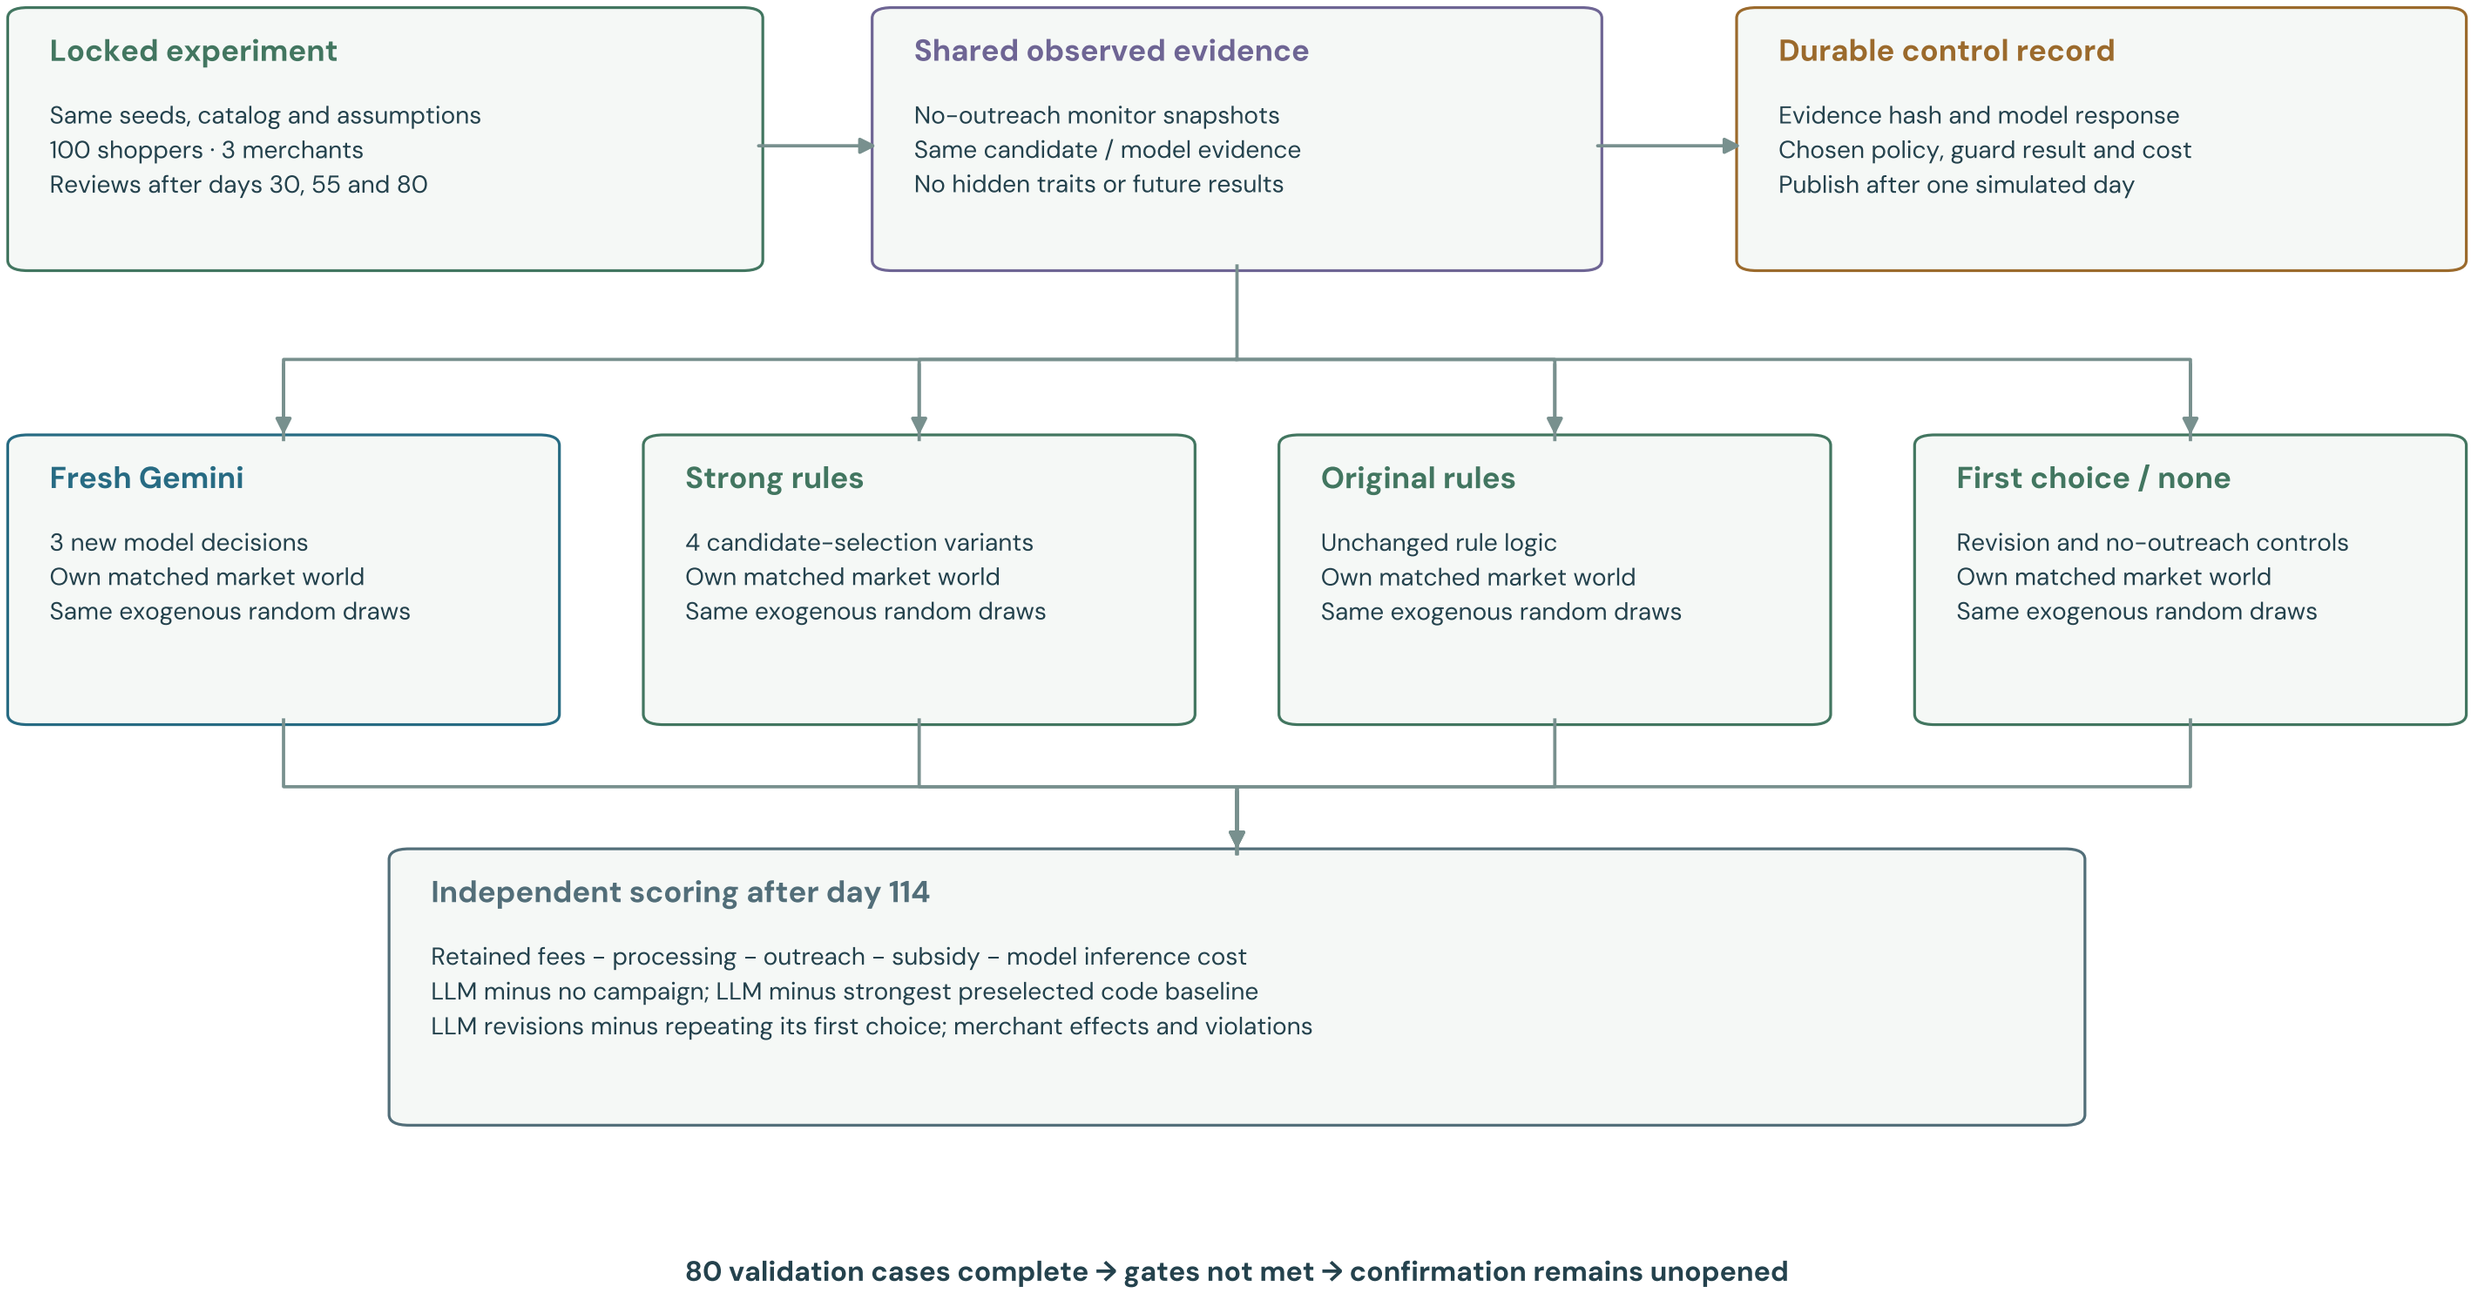

Logical components inside one local app, plus external providers · Snapshot: 25 October 2026

Solid arrows: v5 benchmark flow. Dashed connection: existing live-app sandbox samples, outside the v5 trial.
Channel3 is a catalog source. Native receipts are linked samples, not extra simulated sales. Planes are responsibilities, not independent microservices.

B · Evaluation: equal inputs, separate outcomes

v5 validation complete: 80 cases · economic gates not met · independent confirmation not run

80 validation cases complete → gates not met → confirmation remains unopened

Future evaluation outcomes do not feed back into the agent. Its revisions use shared observed market data and its previous choices.
Confidence intervals resample seed clusters, not individual shoppers. A win requires positive mean/uncertainty gates, not a selected successful seed.

C · One recorded review: facts → decision → effect → score

Development example: CAMP5-pilot-2fcb4d2284fa390e · illustrative, not confirmatory evidence

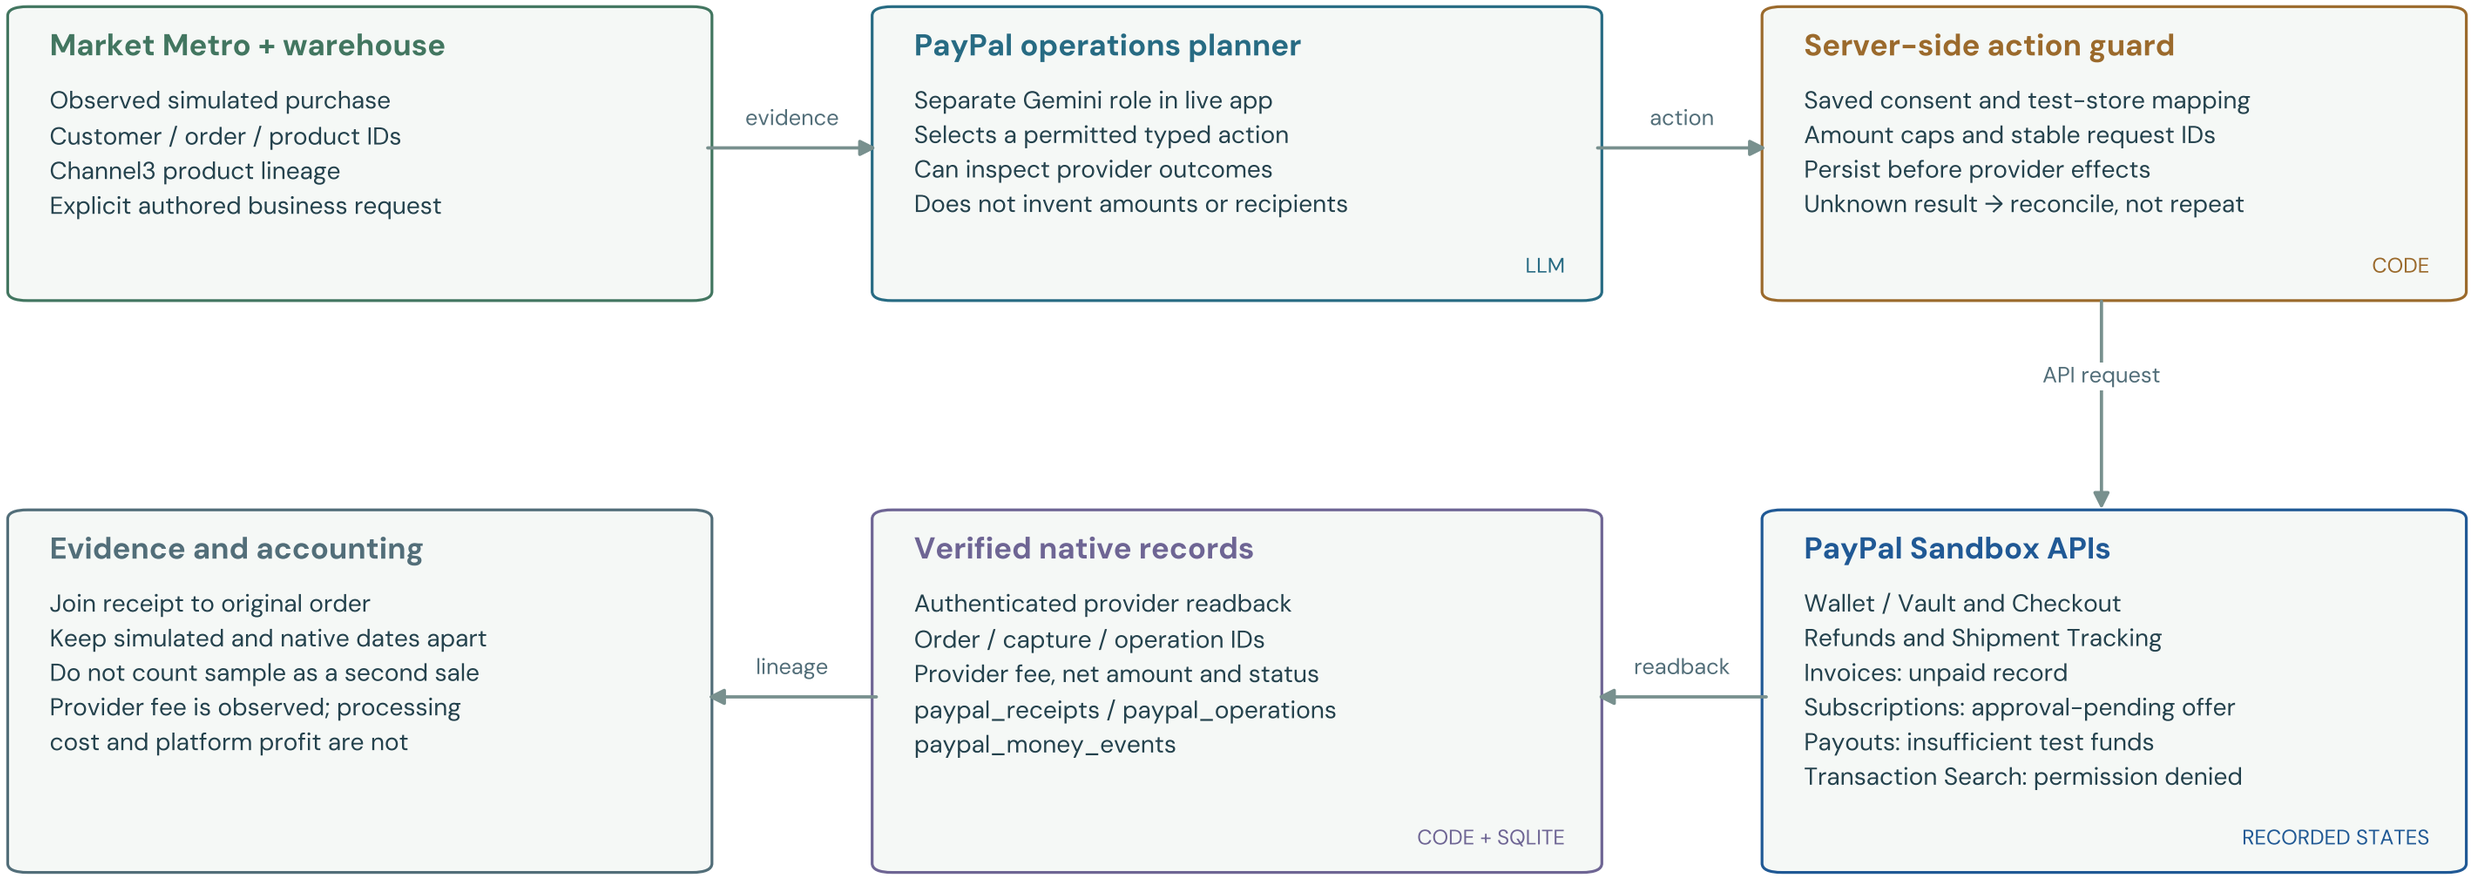

235 recommendations across the run · 0 coupons · 935 purchases · $0.008885 model cost

This is one development market. The full-run gain must not be attributed solely to the day-80 decision.
The first-choice control shares the earlier choices but repeats the initial campaign; its cheaper one-call cost is included. Repeatable gains remain unproven.

D · Where PayPal is used in the live application

Recorded sandbox service evidence from 24 October 2026 · separate from the new policy benchmark

Six service workflows have recorded sandbox readback; unpaid invoices and unactivated subscription offers are not sales.
No production funds, no webhook integration claim, and no new native payment in v5. API integration evidence does not prove PayPal profit.
